weak materials. Areas with numerous old/inactive landslides. Moderate landslide susceptibility

-→-→→ Creep

Areas with moderately steep slopes. Soil creep and other indications of possible landslide occurrence are present.

Gently sloping areas with no identified landslide.

Areas that could be affected by landslide debris.

- Tension crack Landslide area with mitigating measure $\rightarrow \rightarrow \rightarrow$ Gully Riverbank erosion

Areas susceptible to ground subsidence/sinkhole development

Very high flood susceptibility

Areas likely to experience flood heights of greater than 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods.

Areas likely to experience flood heights of greater than 1 up to 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods.

Moderate flood susceptibility

Areas likely to experience flood heights of greater than 0.5m up to 1 meter and/or flood duration of 1 to 3 days. These areas are subject to widespread inundation during prolonged and extensive heavy rainfall or extreme weather condition. Fluvial terraces, alluvial fans, and infilled valleys are areas moderately

Areas likely to experience flood heights of 0.5 meter or less and/or flood duration of less than 1 day. These areas include low hills and gentle slopes. They also have sparse to moderate drainage density.
