## Landslide

-  **Very high landslide susceptibility**  
Areas usually with steep to very steep slopes and underlain by weak materials. Recent landslides, escarpments and tension cracks are present. Human initiated effects could be an aggravating factor.
  -  **High landslide susceptibility**  
Areas usually with steep to very steep slopes and underlain by weak materials. Areas with numerous old/inactive landslides.
  -  **Moderate landslide susceptibility**  
Areas with moderately steep slopes. Soil creep and other indications of possible landslide occurrence are present.
  -  **Low landslide susceptibility**  
Gently sloping areas with no identified landslide.
  -  **Debris flow / Possible accumulation zone**  
Areas that could be affected by landslide debris.  
  -  Active landslide
  -  Inactive landslide
  -  Landslide area with mitigating measure
  -  Rock fall/Rock slide prone area
  -  Old landslide deposits
  -  Recent landslide deposits
  -  Areas susceptible to ground subsidence/sinkhole development  
  -  Creep
  -  Tension crack
  -  Gully
  -  Riverbank erosion

## Flood

- 
- | Flood Susceptibility Level     | Description  |
|--------------------------------|--|
| Very high flood susceptibility | Areas likely to experience flood heights of greater than 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods.         |
| High flood susceptibility      | Areas likely to experience flood heights of greater than 1 up to 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods. |
| Moderate flood susceptibility  | Areas likely to experience flood heights of greater than 0.5m up to 1 meter and/or flood duration of 1 to 3 days. These areas are subject to widespread inundation during prolonged and extensive heavy rainfall or extreme weather condition. Fluvial terraces, alluvial fans, and infilled valleys are areas moderately subjected to flooding.   |
| Low flood susceptibility       | Areas likely to experience flood heights of 0.5 meter or less and/or flood duration of less than 1 day. These areas include low hills and gentle slopes. They also have sparse to moderate drainage density.   |

-  Direction of rising floodwater  
 Direction of receding floodwater  
 Flood depth (meter)  
 Flashflood exit point
