|  | Active landslide |  | Creep |
|  | Inactive landslide |  | Tension crack |
|  | Landslide area with mitigating measure |  | Gully |
|  | Rock fall/Rock slide prone area |  | Riverbank erosion |
|  | Old landslide deposits | | |
|  | Recent landslide deposits | | |
|  | Areas susceptible to ground subsidence/sinkhole development | | |

| | |
|---|--|
|  | Very high flood susceptibility Areas likely to experience flood heights of greater than 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods. |
|  | High flood susceptibility Areas likely to experience flood heights of greater than 1 up to 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods. |
|  | Moderate flood susceptibility Areas likely to experience flood heights of greater than 0.5m up to 1 meter and/or flood duration of 1 to 3 days. These areas are subject to widespread inundation during prolonged and extensive heavy rainfall or extreme weather condition. Fluvial terraces, alluvial fans, and infilled valleys are areas moderately subjected to flooding. |
|  | Low flood susceptibility Areas likely to experience flood heights of 0.5 meter or less and/or flood duration of less than 1 day. These areas include low hills and gentle slopes. They also have sparse to moderate drainage density. |

-  Direction of rising floodwater
 Direction of receding floodwater
 Flood depth (meter)
 Flashflood exit point
