Landslide

- Very high landslide susceptibility**
Areas usually with steep to very steep slopes and underlain by weak materials. Recent landslides, escarpments and tension cracks are present. Human initiated effects could be an aggravating factor.

High landslide susceptibility
Areas usually with steep to very steep slopes and underlain by weak materials. Areas with numerous old/inactive landslides.

Moderate landslide susceptibility
Areas with moderately steep slopes. Soil creep and other indications of possible landslide occurrence are present.

Low landslide susceptibility
Gently sloping areas with no identified landslide.

Debris flow / Possible accumulation zone
Areas that could be affected by landslide debris.

Active landslide (Black line with triangles pointing up)

Inactive landslide (Dashed black line with triangles pointing up)

Tension crack (Blue line with triangles pointing up)

Landslide area with mitigating measure (Pink line with triangles pointing up)

Gully (Grey line with triangles pointing up)

Rock fall/Rock slide prone area (Black line with circles)

Riverbank erosion (Orange line with triangles pointing up)

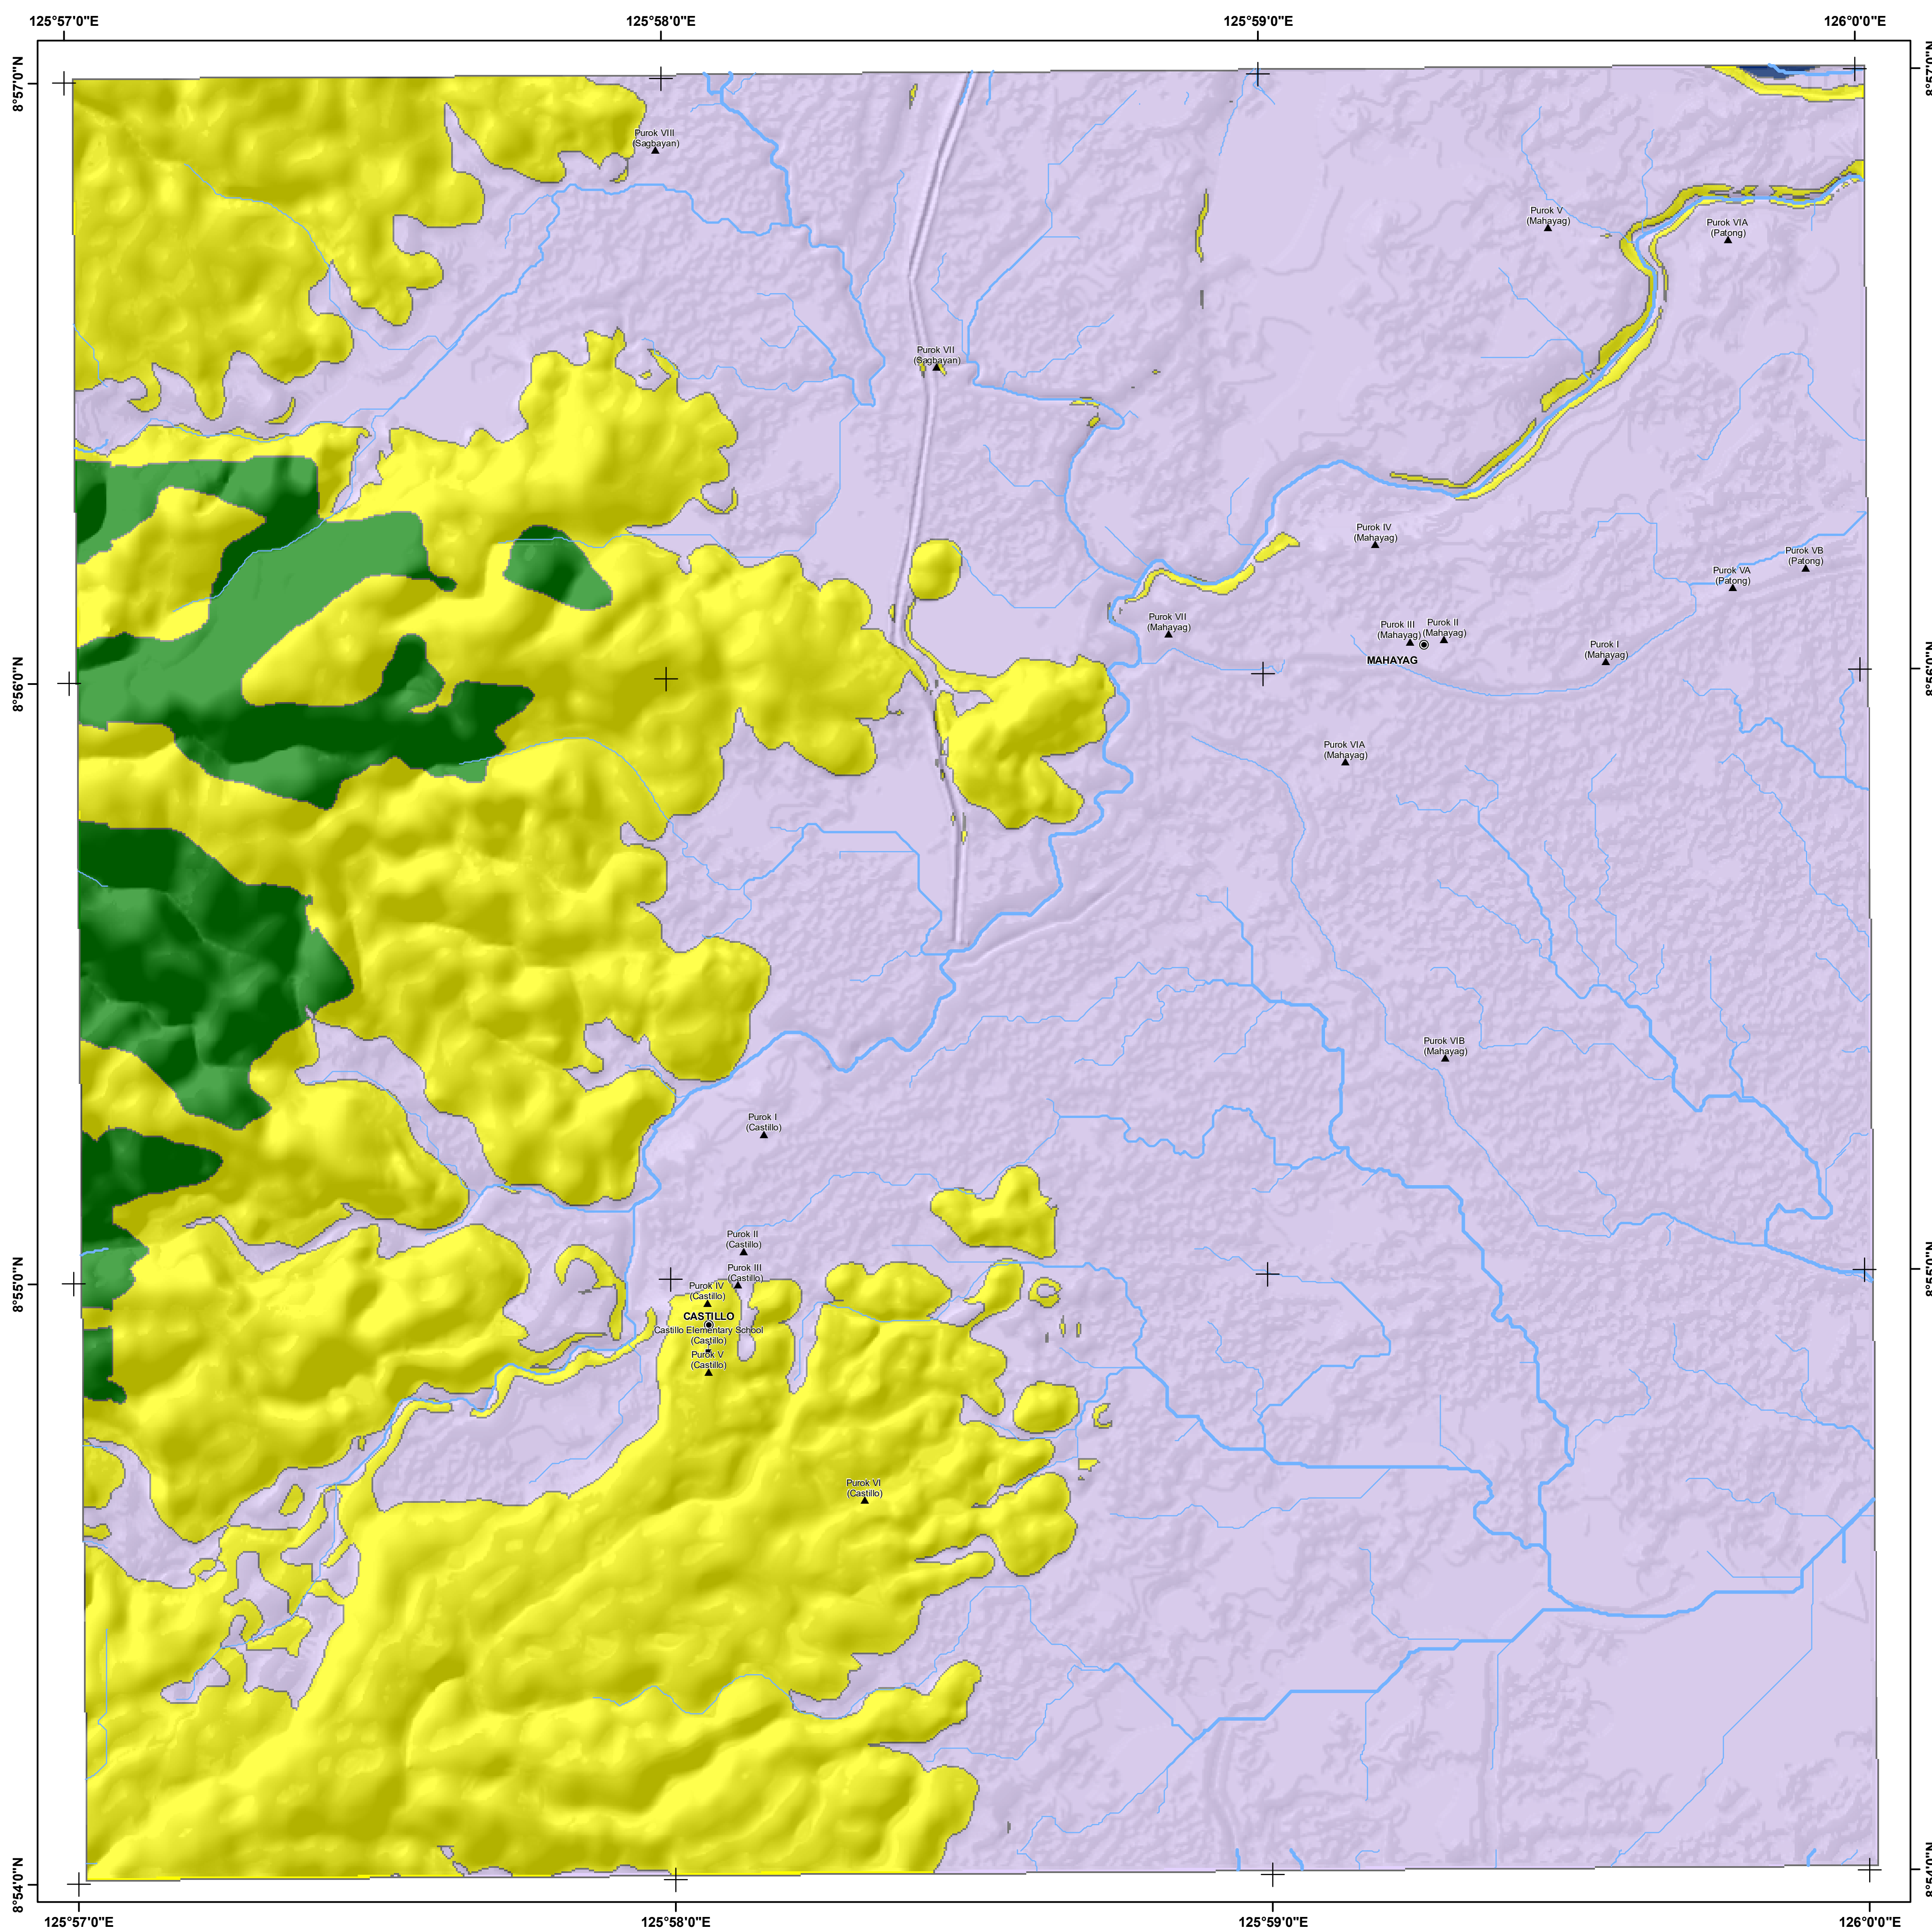

Old landslide deposits (Blue hatched circle)

Recent landslide deposits (Black hatched circle)

Areas susceptible to ground subsidence/sinkhole development (Grey hatched circle)

Flood

-
- The diagram illustrates four levels of flood susceptibility, each with a corresponding color-coded box and a description of the areas likely to be affected. The levels are arranged vertically from top to bottom: Very high, High, Moderate, and Low.
- Very high flood susceptibility** (Dark blue box): Areas likely to experience flood heights of greater than 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods.
 - High flood susceptibility** (Purple box): Areas likely to experience flood heights of greater than 1 up to 2 meters and/or flood duration of more than 3 days. These areas are immediately flooded during heavy rains of several hours; include landforms of topographic lows such as active river channels, abandoned river channels and area along river banks; also prone to flashfloods.
 - Moderate flood susceptibility** (Light purple box): Areas likely to experience flood heights of greater than 0.5m up to 1 meter and/or flood duration of 1 to 3 days. These areas are subject to widespread inundation during prolonged and extensive heavy rainfall or extreme weather condition. Fluvial terraces, alluvial fans, and infilled valleys are areas moderately subjected to flooding.
 - Low flood susceptibility** (Lightest purple box): Areas likely to experience flood heights of 0.5 meter or less and/or flood duration of less than 1 day. These areas include low hills and gentle slopes. They also have sparse to moderate drainage density.
- At the bottom of the diagram, two arrows indicate the direction of rising and receding floodwater, and a symbol indicates the flood depth (meter) and the flashflood exit point.
- Direction of rising floodwater
- Direction of receding floodwater
- $1 \div 2$
⊗ Flood depth (meter)
- Flashflood exit point
